SUBSTITUTED THIAZOLES AND OXAZOLES THAT MODULATE PPAR ACTIVITY

FIELD OF THE INVENTION

5

The present invention relates to compounds and pharmaceutical formulations that can be used to treat conditions mediated by nuclear receptors, more specifically, to compounds and pharmaceutical formulations that modulate PPAR activity.

10

BACKGROUND OF THE INVENTION

Hypercholesterolemia, hyperlipidemia, and diabetes are well recognized risk factors in the onset of atherosclerosis and coronary heart disease.

15

Hypercholesterolemia and hyperlipidemia are characterized by excessively high levels of blood cholesterol and lipids. The blood cholesterol pool is generally dependent on dietary uptake of cholesterol from the intestine and biosynthesis of cholesterol throughout the body, especially the liver. The majority of cholesterol in plasma is carried on apolipoprotein B-containing lipoproteins, such as low-density lipoproteins (LDL) and very-low-density lipoproteins (VLDL). The risk of coronary artery disease in man increases when LDL and VLDL levels increase. Conversely, high levels of cholesterol carried in high-density lipoproteins (HDL) is protective against coronary artery disease (Am. J. Med., 1977; 62:707-714).

20

25

The statins represent perhaps the most important class of lipid-lowering drugs. These compounds inhibit HMG-CoA reductase which is implicated in the rate-limiting step in cellular cholesterol biosynthesis. Representative statins include atorvastatin, lovastatin, pravastatin, and simvastatin. The effectiveness of these compounds depends on LDL receptor regulation. Other important antilipidemia drugs include fibrates such as gemfibрил and clofibrate, bile acid sequestrants such as cholestyramine and colestipol, probucol, and nicotinic acid analogs.

30

To date, a number of oral antidiabetic agents have been developed. The most commonly used hypoglycemic drugs are the sulfonylureas. Sulfonylureas are generally used to stimulate insulin. The biguanide metformin is generally used to improve insulin sensitivity and to decrease hepatic glucose output. Acarbose is used to limit postprandial hyperglycemia. Thiazolidine 2,4 diones are used to enhance insulin action without increasing insulin secretion.

Peroxisome Proliferator Activation Receptors (PPAR) are implicated in a number of biological processes and disease states including hypercholesterolemia, hyperlipidemia, and diabetes. PPARs are members of the nuclear receptor superfamily of transcription factors that includes steroid, thyroid, and vitamin D receptors. They play a role in controlling expression of proteins that regulate lipid metabolism. Furthermore, the PPARs are activated by fatty acids and fatty acid metabolites. There are three PPAR subtypes PPAR α , PPAR β (also referred to as PPAR δ), and PPAR γ . Each receptor shows a different pattern of tissue expression, and differences in activation by structurally diverse compounds. PPAR γ , for instance, is expressed most abundantly in adipose tissue and at lower levels in skeletal muscle, heart, liver, intestine, kidney, vascular endothelial and smooth muscle cells as well as macrophages. PPAR receptors are associated with regulation of insulin sensitivity and blood glucose levels, macrophage differentiation, inflammatory response, and cell differentiation. Accordingly, PPARs have been associated with obesity, diabetes, carcinogenesis, hyperplasia, atherosclerosis, hyperlipidemia, and hypercholesterolemia.

In addition, PPAR α agonists lower plasma triglycerides and LDL cholesterol and are therefore useful in treating hypertriglyceridemia, hyperlipidemia and obesity. PPAR γ is associated with the development of non-insulin-dependent diabetes mellitus (NIDDM), hypertension, coronary artery disease, hyperlipidemia and certain malignancies. Finally, activation of PPAR β has been demonstrated to increase HDL levels. (Leibowitz, WO97/28149, Aug. 1997.) More recently, a PPAR β

selective agonist was reported to have shown a dose-related increase in serum HDL-C and decrease in LDL-C and VLDL-TG in insulin-resistant middle aged rhesus monkeys. (W. R. Oliver et al., PNAS, v. 98, pp. 5306-5311, 2001)

5 Antilipidemic and antidiabetic agents are still considered to have non-uniform effectiveness. The effectiveness of antidiabetic and antilipidemic therapies is limited, in part because of poor patient compliance due to unacceptable side effects. These side effects include diarrhea and gastrointestinal discomfort, and in the case of antidiabetics, edema, hypoglycemia and hepatotoxicity. Furthermore, each type of drug
10 does not work equally well in all patients.

For the reasons set forth above, there is a need for novel antilipidemic and antidiabetic agents that can be used alone or in combination. Furthermore, activation of PPAR β alone or in combination with the simultaneous activation of PPAR α
15 and/or PPAR γ may be desirable in formulating a treatment for hyperlipidemia in which HDL is increased and LDL lowered.

Accordingly, the compounds of the present invention can be administered to a patient alone or as part of a composition that contains other components such as excipients, diluents, and carriers, all of which are well-known in the art. The compositions can be administered to humans and animals either orally, rectally, parenterally (intravenously, intramuscularly, or subcutaneously), intracisternally, intravaginally, intraperitoneally, intravesically, locally (powders, ointments, or drops), or as a buccal or nasal spray.

15

20

25

Compositions suitable for parenteral injection may comprise physiologically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, and sterile powders for reconstitution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (propyleneglycol, polyethyleneglycol, glycerol, and the like), suitable mixtures thereof, vegetable oils (such as olive oil),

Prevention of the action of microorganisms can be ensured by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic agents, for example sugars, sodium chloride, and the like. Prolonged
10 absorption of the injectable pharmaceutical form can be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

- Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is admixed
15 with at least one inert customary excipient (or carrier) such as sodium citrate or dicalcium phosphate or (a) fillers or extenders, as for example, starches, lactose, sucrose, glucose, mannitol, and silicic acid; (b) binders, as for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia; (c) humectants, as for example, glycerol; (d) disintegrating agents, as for example,
20 agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain complex silicates, and sodium carbonate; (e) solution retarders, as for example paraffin; (f) absorption accelerators, as for example, quaternary ammonium compounds; (g) wetting agents, as for example, cetyl alcohol and glycerol monostearate; (h) adsorbents, as for example, kaolin and bentonite; and (i) lubricants, as for
25 example, talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, or mixtures thereof. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethyleneglycols, and the like.

- 5 Solid dosage forms such as tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells, such as enteric coatings and others well-known in the art. They may contain opacifying agents, and can also be of such composition that they release the active compound or compounds in a certain part of the intestinal tract in a delayed manner. Examples of embedding compositions which can be used
10 are polymeric substances and waxes. The active compounds can also be in micro-encapsulated form, if appropriate, with one or more of the above-mentioned excipients.

- Liquid dosage forms for oral administration include pharmaceutically
15 acceptable emulsions, solutions, suspensions, syrups, and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art, such as water or other solvents, solubilizing agents and emulsifiers, as for example, ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propyleneglycol, 1,3-butyleneglycol, dimethylformamide,
20 oils, in particular, cottonseed oil, groundnut oil, corn germ oil, olive oil, castor oil and sesame oil, glycerol, tetrahydrofurfuryl alcohol, polyethyleneglycols and fatty acid esters of sorbitan or mixtures of these substances, and the like.

10

Dosage forms for topical administration of a compound of this invention include ointments, powders, sprays, and inhalants. The active component is admixed under sterile conditions with a physiologically acceptable carrier and any
preservatives, buffers, or propellants as may be required. Ophthalmic formulations,
15 eye ointments, powders, and solutions are also contemplated as being within the scope of this invention.

The compounds of the present invention can be administered to a patient at dosage levels in the range of about 0.1 to about 2,000 mg per day. For a normal
20 human adult having a body weight of about 70 kilograms, a dosage in the range of about 0.01 to about 100 mg per kilogram of body weight per day is preferable. The synthetic route of compounds in the present invention is not limited to the methods outlined below. It is assumed one skilled in the art will be able to use the schemes outlined below to synthesize compounds claimed in this invention. Individual compounds may require manipulation of the conditions in order to accommodate various functional groups. A variety of protecting groups generally known to one skilled in the art may be required. Purification, if necessary, can be accomplished on a silica gel column eluted with the appropriate organic solvent system. Also, reverse phase HPLC or recrystallization may be employed as needed.

In still another embodiment of the present invention, a method of preparing the compounds of the present invention is provided. The method of the present invention comprises reaction of a compound having Formula:

in a solvent in the presence of a base such as cesium carbonate with:

wherein

$V^1, R^1, R^2, R^3, R^4, R^5, R^6, X^0, X^1, X^2, Ar^1, m, n,$ and p are the same as described above;

X is a halogen; and

R^{10} is a lower alkyl.

5

The resulting ester is then converted to the compounds of Formulae 1 and 2 by various methods known in the art for the conversion of esters to acids, such as via hydrolysis for example. A useful aryl halide, for example, is 5-chloromethyl-4-methyl-2-(4-trifluoromethyl-phenyl)-thiazole. Compounds 1, 1a-e, 2, 2a-e, and 3-53
10 will be provided when T and V^1 are defined as given above.

The compounds of the present invention can be prepared using the synthetic route outlined in Scheme 1. With reference to Scheme 1, compound A is converted to the ester B. Although any compatible method for esterification may be used, a useful
15 method is to react compound A with an alcohol, such as methanol, in the presence of an acid such as hydrochloric acid. Ester B is then reacted with chlorosulfonic acid to form compound C. Compound C is then reduced to form compound D. Compound D is then alkylated with the halide compound E to form compound F. A useful
20 halide compound E is 5-chloromethyl-4-methyl-2-(4-trifluoromethyl-phenyl)-thiazole, for example. Compound F is then saponified with aqueous LiOH in the THF to give the final compound G. $Ar^1, X^0, X^1, R^1, R^2, R^3,$ and R^4 are the same as defined above for Formulas 1-2 above; X is a halogen. Compound G corresponds to the compounds described by Formula 1-2 above when X^0 is S. Specifically, compound G corresponds to Formula 2 when R^1 and R^2 are joined together to form a ring.

Scheme 1

- 5 Alternatively, the compounds of the present invention can be prepared using the synthetic route outlined in Scheme 2. With reference to Scheme 2, compound H is reacted with a reducing agent such as Dibal to form compounds with formula I. Compound I is then reacted with dimethyl malonate to form compounds with formula J. Compounds with formula J is then reacted with cholorsulfonic acid followed by a
- 10 reduction to form compound K. Compound K is then alkylated with the halide compound E. The resulting compound is then reacted with acid to form compound L. A useful halide compound E is 5-chloromethyl-4-methyl-2-(4-trifluoromethyl-

phenyl)-thiazole, for example. Compound L corresponds to the compounds described by Formula 1-2 above when V^1 is $-\text{CH}_2\text{-CH}_2\text{-CH-O-}$, X^0 is S, and n is 1. Specifically, compound L corresponds to Formula 2 when R^1 and R^2 are joined together to form a ring, V^1 is $-\text{CH}_2\text{-CH}_2\text{-CH-O-}$, and n is 1.

5

Scheme 2

Scheme 3 provide yet another synthetic route to the compounds of the present invention. Compound H is reacted with chlorosulfonic acid followed by reduction to form compound M. Compound M is then alkylated with the halide compound E to form compound N. A useful halide compound E is 5-chloromethyl-4-methyl-2-(4-trifluoromethyl-phenyl)-thiazole, for example. Compound N is reacted with a

10

- 36 -

reducing agent such as Dibal to form compounds with formula O. Compound O is reacted with Wittig reagent P to form compound Q. Compound Q is then saponified with aqueous LiOH to form compound L. W, Y, Ar¹, X⁰, X¹, R¹, R², R³, and R⁴ are the same as defined above for Formulas 1-2 above; X is a halogen. Compound L corresponds to the compounds described by Formula 1-2 above when X⁰ is S. Specifically, compound L corresponds to Formula 2 when R¹ and R² are joined together to form a ring.

10

Scheme 3

15

Another alternative synthetic route to the compounds of the present invention is provided in Scheme 4. Compound R may be prepared by de-methylation of the corresponding methyl ether with boron tribromide. Compound S is prepared by thiocarbamoylation of compound R. Compound T is then prepared by a Newman-Karnes rearrangement of compound S in refluxing diphenyl ether. Saponification and re-esterification of compound S then gives compound D. Compound D is then

20

- alkylated with the halide compound E to form compound F. A useful halide compound E is 5-chloromethyl-4-methyl-2-(4-trifluoromethyl-phenyl)-thiazole, for example. Compound F is then saponified with aqueous LiOH in the THF to give the final compound G. R¹, R², R³, and R⁴ are the same as defined above for Formulas I-IV above; X is a halogen. Compound G corresponds to the compounds described by Formula 1-2 above. Specifically, compound G corresponds to Formula 2 when R¹ and R² are joined together to form a ring.

A. Selectivity Measurements

1. Test A. Transient transfections assay using the HepG2 hepatoma cell line.

5

HepG2 cells were transiently transfected with an expression plasmids encoding hPPAR α , hPPAR β or mPPAR γ chimeric receptors and a reporter containing the yeast upstream activating sequence (UAS) upstream of the viral E1B promoter controlling a luciferase reporter gene. In addition, the plasmid pRSV β -gal was used to control for transfection efficiency. HepG2 cells were grown in DMEM 10 supplemented with 10%FBS and 1 μ M non-essential amino acid. On the first day, cells were split into 100mm dishes at 2.5x10⁶/dish and incubated overnight at 37C°/5% CO₂. On the second day the cells were transiently transfected with plasmid DNA encoding a chimeric receptor, the luciferase reporter gene; and β -gal. For each 15 100 mm dish, 15 μ g of luciferase reporter (PG5E1b) DNA, 15 μ g of Gal4-PPAR chimeric receptor DNA, and 1.5 μ g of β -gal plasmid DNA were mixed with 1.4ml of opti-MEM in the tube. 28 μ l of LipoFectamine-2000 reagent was added to 1.4ml of opti-MEM in the tube, and incubate for 5 min at RT. The diluted Lipofectamine-2000 reagent was combined with the DNA mixture, and incubate for 20 min at RT. After 20 fresh medium was added to each 100mm dish of cells, 2.8ml of Lipofectamine2000-DNA mixture was added dropwise to the 100mm dish containing 14ml of medium, and incubate 37°C overnight. On day three cells were trypsinized off the 100 mm dishes and re-plated on 96 well plates. Cells were plated at 2.5x10⁴ cells per well in 150 μ l of media and 50 μ l of compound diluted by media was added. The 25 concentrations of reference agents and test compound added were in the range from 50 μ M to 50pM. After addition of compounds, the plates were incubated at 37C° for 24 hours. Subsequently cells were washed once with 100 μ l of PBS, lysed, and processed for measuring luciferase and β -gal activity using Dual-Light luciferase kit from Tropix ®, according to the manufacturer's recommendations, on an EG&G

INTERNATIONAL SEARCH REPORT

Int. application No.
CT/IB 03/00882

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 10-13 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
